

PartyRock Prompts Used

This file documents the exact prompts used to build the Migrant Wage Checker app on PartyRock, for transparency and reproducibility.

1. Initial App Generation Prompt

Used to generate the app skeleton (input widgets + output widget) via PartyRock's "Generate an app" feature:

```
Build an app called "Migrant Wage Checker" for Indian migrant workers to check if they are being paid fairly.
```

```
The app should have these inputs:
```

1. State (dropdown or text: Delhi, Karnataka, Maharashtra, Tamil Nadu, Rajasthan, Gujarat, Madhya Pradesh, Uttar Pradesh, Bihar, West Bengal, Punjab, Haryana, Telangana, Kerala, Odisha)
2. Job category (Construction, Agriculture, Domestic Work, Factory Work)
3. Skill level (Unskilled, Semi-Skilled, Skilled)
4. What they are actually being paid per day (in Rupees)

```
The app should look up the correct minimum daily wage for that state, job category, and skill level from a reference data table, compare it to what the worker says they are actually being paid, and respond in simple, respectful language:
```

- If they are being paid fairly or above minimum wage, confirm this clearly
- If they are being underpaid, clearly state the

shortfall amount and explain they may be a victim of wage theft

- Always end by mentioning they can file a complaint with the Labour Department helpline (number: 155214)

Keep the tone simple and easy to understand for someone with basic literacy, not legal or technical language.

2. Output Widget Refinement – Bilingual (Hindi + English) Response

Added to the "Wage Fairness Result" widget prompt after initial testing, to make the app accessible to migrant workers who are more comfortable reading Hindi than English:

IMPORTANT: Respond in simple Hindi (Devanagari script) first, followed by a short English summary. Most migrant workers understand Hindi better than English, but keep both versions available. Keep the language very simple and respectful.

Use a single bilingual heading at the top that works for both language readers, like "आपकी मजदूरी की जांच / Your Pay Check". Do NOT use separate section labels like "Hindi Response" or "English Summary" anywhere in the output – the Hindi and English portions should flow naturally under this one shared heading, with no internal headers separating them.

3. Reference Data

The app uses a built-in reference table (based on `minimum_wage_data.csv` in this repo) covering state × job category × skill level combinations, compiled from 2026 state labour department minimum wage notifications.

Why This Approach

Rather than writing custom backend logic to look up wage data and compare it against user input, the entire lookup + comparison + tone-of-response logic is handled by describing intent in plain language to the foundation model (via PartyRock/Amazon Bedrock). This meant no traditional coding was needed to build a fully functional data-driven tool.
